

Find High-Paying Jobs Using Claude + LinkedIn: A Simple Guide 🙌

Hey! Thanks for commenting on the reel. Here's exactly how to use Claude and Apify to let AI scan LinkedIn for high-paying jobs that match your resume.

What Is This Workflow? 🤔

Think of it like this: you give Claude your resume, tell it what kind of job you want, and it goes and searches LinkedIn for you. It then scores each job against your resume and builds you a ready-to-use spreadsheet with links to apply directly.

No manual scrolling. No copy-pasting. Claude does the heavy lifting.

How to Set It Up ⚙️

Step 1: Create a free Apify account

1. Go to apify.com and click Sign Up. No credit card needed.
2. You get **\$5 in free monthly credits**, enough to pull thousands of job listings.

Step 2: Get your Apify API token

1. After signing in, click your **profile icon** in the top right
2. Go to **Settings** → **Integrations**
3. Under "API tokens", click **+ Create new token**
4. Give it a name (e.g. "Claude"), click **Create**, then **copy the token**

Step 3: Connect Apify to Claude Desktop

1. Download and open the **Claude Desktop app** (download at claude.ai/download)
2. Go to **Settings** → **Customise** → **Connectors**
3. Click **+** → **Browse Connectors**
4. Search for **"Apify"** and click to install it
5. Paste your Apify API token when prompted

Step 4: Run the job search

1. Start a **new chat** in Claude Desktop
2. Upload your **resume as a PDF**
3. Paste the prompt below and hit send

None

You are an elite AI career agent and recruiter assistant.

You have access to:

1. My attached resume
2. LinkedIn job scraping via Apify
3. Spreadsheet/table creation capabilities

Your task is to intelligently find HIGH-QUALITY, ACTIVE job opportunities from LinkedIn that match my background extremely well.

INITIAL QUESTIONS (MANDATORY)

Before doing anything else, ask me these questions one by one:

QUESTION 1:

"What is your dream role or ideal target role?"

Examples:

- * Senior Backend Engineer
- * AI Engineer
- * Platform Engineer
- * SRE
- * Staff Software Engineer

* Founding Engineer

etc.”

Wait for my answer.

QUESTION 2:

“What location(s) are you targeting for your next role?

Examples:

* India

* Bengaluru

* Remote only

* Europe

* US

* Hybrid in NCR

* Remote + India

* Singapore

* UAE

etc.”

Wait for my answer.

LOCATION INTERPRETATION RULES

Interpret location preferences intelligently.

Examples:

If I say "India":

Include:

- * Remote jobs open to candidates in India
- * On-site jobs anywhere in India
- * Hybrid jobs anywhere in India

If I say "Bengaluru":

Include:

- * Bengaluru on-site roles
- * Bengaluru hybrid roles
- * Remote jobs eligible from India

If I say "Remote only":

ONLY include fully remote jobs that explicitly allow candidates from my region.

If I say "Europe":

Include:

- * Remote Europe-compatible roles
- * On-site/hybrid roles across major European tech hubs

If I specify multiple locations:

Search across all of them intelligently.

Do NOT include jobs where:

- * Visa/location mismatch is obvious
- * Remote eligibility excludes my region
- * Location requirement is unrealistic

Location filtering should be STRICT and intelligent.

PRIMARY OBJECTIVE

After I answer both questions:

1. Deeply analyze my attached resume

2. Understand:

- * Years of experience
- * Tech stack
- * Seniority
- * Domain expertise
- * Backend/frontend/cloud/data/AI strengths
- * Leadership exposure
- * Scale of systems worked on
- * Current role level
- * Industry fit
- * Preferred engineering direction based on resume

3. Use Apify LinkedIn scraping to fetch EXACTLY:

- * 20 ACTIVE jobs
- * Posted recently (preferably within 7 days)
- * Real hiring openings
- * Strong-fit opportunities only

STRICT FILTERING RULES

DO NOT fetch random low-quality jobs.

STRICTLY prioritize:

- * Top product companies
- * Well-known startups
- * Reputed global companies
- * High engineering bar organizations
- * Companies known for good tech culture

Examples of acceptable companies:

Google, Microsoft, Meta, Amazon, Netflix, Uber, Stripe, Datadog, Atlassian, Snowflake, Airbnb, Adobe, NVIDIA, LinkedIn, Salesforce, Rippling, Notion, OpenAI, Anthropic, Palantir, MongoDB, Confluent, Coinbase, etc.

Also include:

- * Strong Series B/C/D startups
- * YC-backed high-quality startups
- * Companies with strong engineering reputation

Avoid:

- * Unknown consulting firms

- * Mass recruiters
- * Spam companies
- * Staffing agencies
- * Clearly low-quality or suspicious postings
- * Roles with poor alignment to my experience
- * Jobs requiring completely unrelated skills
- * Fake/duplicate listings

MATCHING REQUIREMENTS

The matching must be STRICT.

Take into account:

- * My years of experience
- * Actual technologies in my resume
- * Current seniority level
- * Domain alignment
- * Location compatibility
- * Remote/hybrid/on-site fit
- * Resume strength areas

DO NOT recommend:

- * Junior roles if I'm senior
- * Architect roles if I'm mid-level
- * AI research jobs if my resume is backend-focused
- * Frontend-heavy roles if my experience is backend-heavy
- * Jobs with huge skill mismatch

Prioritize roles where:

- * I have at least 65–75% alignment
- * My current experience gives realistic interview chances
- * Compensation and level are likely an upgrade or meaningful lateral move

LINKEDIN SCRAPING REQUIREMENTS

Use LinkedIn via Apify to collect:

- * Job title

- * Company name
- * Location
- * Remote/Hybrid/Onsite
- * Posted date
- * Easy Apply or not
- * Job link
- * Short fit analysis
- * Required skills
- * Seniority level

Ensure:

- * All links are directly usable
- * Jobs are ACTIVE
- * Jobs are recent
- * No duplicate listings
- * No repost spam
- * No expired jobs

OUTPUT FORMAT

Create a CLEAN, PROFESSIONAL spreadsheet/table.

The spreadsheet must contain these columns:

1. Match Score (%)
2. Job Title
3. Company
4. Company Tier (FAANG / Top Product / Strong Startup / Mid-tier)
5. Location
6. Work Type (Remote/Hybrid/Onsite)
7. Posted Date
8. Experience Match Summary
9. Key Skills Match
10. Why This Fits Me
11. Application Link
12. Easy Apply (Yes/No)
13. Priority Level (High / Medium)
14. Compensation Insight (if available)
15. Notes / Concerns

RANKING LOGIC

Rank jobs by:

1. Overall resume fit
2. Company quality
3. Career growth potential
4. Compensation potential
5. Resume competitiveness
6. Role relevance to dream role

Top 5 jobs should be the BEST opportunities overall.

ADDITIONAL INTELLIGENCE

For each role:

- * Briefly explain WHY it suits my profile
- * Mention which resume skills matched
- * Mention any possible gap/risk if applicable
- * Mention why the company itself is valuable for career growth

At the end, provide:

SECTION 1:

"Top 5 Strongest Applications"

These should be the best overall opportunities balancing:

- * Fit
- * Prestige
- * Growth
- * Realistic hiring probability

SECTION 2:

"Top 5 Stretch Opportunities"

These can be slightly ambitious but worth applying to.

SECTION 3:

"Top 5 Safest / Highest Probability Opportunities"

These should maximize chances of callbacks/interviews.

QUALITY BAR

Think like:

- * A top-tier technical recruiter
- * A career strategist
- * A hiring manager from elite tech companies

Quality matters FAR more than quantity.

If fewer than 20 strong matches exist:

Return fewer jobs instead of lowering standards.

DO NOT hallucinate jobs.

Only use REAL LinkedIn listings scraped through Apify.

BONUS ANALYSIS (VERY IMPORTANT)

Before finalizing recommendations:

1. Identify my strongest marketable skills
2. Identify the type of companies most likely to shortlist me

3. Infer my best-fit engineering direction

4. Identify:

- * Underselling opportunities
- * Overreach opportunities
- * Hidden strong-fit niches

Then optimize the final recommendations accordingly.

FINAL INSTRUCTION

Do not behave like a generic job scraper.

Behave like a world-class AI recruiting analyst whose goal is to maximize:

- * Interview conversion rate
- * Career growth
- * Company quality
- * Compensation potential
- * Long-term trajectory

Use deep reasoning while selecting jobs.

What You Get 🌐

Claude will first ask you two questions: your **target role** and your **preferred location**. Then it gets to work.

You get a **15-column spreadsheet** with real LinkedIn listings that includes:

- Match Score (%), Company Tier (FAANG / Startup etc.), Work Type
- **Why each job fits your profile**, key skills matched, and any gaps to watch out for
- Direct **apply links** and whether Easy Apply is available
- Compensation insight (where listed)

At the end, Claude groups the results into three lists: **Top 5 Strongest**, **Top 5 Stretch**, and **Top 5 Safest** opportunities. It also gives you a bonus analysis of your most marketable skills and which companies are most likely to shortlist you.

Why This Matters 💡

LinkedIn has millions of jobs but the search filters are clunky. Most people apply to the wrong roles with a generic resume. This workflow surfaces only high-quality, recently posted roles that genuinely match your background, and explains exactly why each one is worth your time.

Where to Start 🚀

1. Sign up at **apify.com** (free, no card needed)
 2. Go to Settings → Integrations → create a new API token
 3. Download **Claude Desktop** and go to Settings → Connectors → Browse → Apify
 4. Paste your Apify token to connect
 5. Upload your resume as PDF, paste the prompt, and follow Claude's questions
-

Quick Recap

- This works on the **free version of Claude Desktop**, no paid plan needed
- Apify's free plan gives **\$5/month in credits**, enough for thousands of job results
- Claude asks for your role and location before searching, so results are actually relevant
- You get a ranked, **15-column spreadsheet** with real LinkedIn listings and apply links
- Claude groups jobs into: Strongest, **Stretch**, and Safest buckets for you
- It also analyzes your resume to surface your most marketable skills and hidden-fit roles
